

# CE-Wedge™

## CE-Wedge's Features

CE-Wedge is an easy-to-use data collection program designed for interfacing serial devices — such as bar code scanners, calipers, micrometers, scales, PDTs, GPSs and other simple RS232 devices — to any Windows CE program. It inputs real-time serial data directly into Pocket Excel, Pocket Word or any other Window CE software program.

CE-Wedge is extremely easy-to-use with a one-screen, one-minute set-up that's supported by complete on-line help. Once configured, just open any Windows CE application and watch data from your serial device pop in exactly where you need it. CE-Wedge converts incoming serial data to keystrokes so it appears in your CE programs just like typed in data.

## CE-Wedge's Features Include:

- Full compatibility with any Pocket PC running Windows CE v3.0.
- Support for COM ports 1 to 4.
- Ability to add additional keystrokes to serial data to automate data entry.

As with all TALtech software, CE-Wedge comes with free, unlimited technical support and a 90-day money-back guarantee.
